                                                                                                                                         The present invention relates to human RH116 (see AAM47798). RH116 is 116kDa protein and has homology to RNA helicases (DEXH box). RH116 and its coding sequence are useful for treating cancer; acute or chronic infections (especially by HIV or hepatitis B or C); inhelited genetic diseases; (auto)immune diseases (particularly rheumatism, arthritis, arteriosclerosis, osteoporosis and diabetes, but many others listed) at to prevent graft rejection. RH116 and its coding sequence are also use for inducing, or increasing, the immune response to a vaccine. The
                                                                                                                                                                                                                                                                                     New polypeptide, useful for treating and diagnosing inflammation, and drug screening, comprises a human homologous to RNA helicase

The present invention relates to the isolation of novel human enzyme polypeptides (AAU22915-AAU23814), and the cDNA and genumic sequences encoding them. The enzyme polypeptides of the invention may comprise
                                    Claim 4;
                                                            Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous
                                                                                                                                                                                                                                                                                          -NOV-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -OCT-2000;

detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                          sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length CDNAs. The primers are also useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes primer sets for synthesis in 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide comprises one of the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Primer sets for synthesizing polynucleotides, particularly the 560 full-length cDNAs defined in the specification, and for the detect and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                    of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises \alpha '-end

IFNA. JFN Connected acids and polypeptides are useful for treating or preventing a cupathology associated with IFN polypeptide in a human. They are useful for determining the presence of or predisposition to a discusse associated controlled the presence of or predisposition to a discusse associated controlled the presence of or predisposition to a discusse associated controlled the predisposition of disquests. IFN nucleic controlled the presence of or predisposition to a discusse associated controlled the profiled and cell profiled the prevention or treatment of variety of immunological and cell profiled the prevention controlled the predistrict of the profiled the profiled the profiled the profiled the profiled the profiled the prevention of the prevention of immunodeficiency virus (HIV), immune-mediated glomerulous phritis, and cancer. In addition they are also useful for treating or disaposing various disorders associated with cell death, including hiselmer's and cancer. In addition they are also useful for treating or disposing various disorders associated with cell death, including Albeimer's and parkinson's diseases, amyotrophic lateral sclerosis and spinal muscular atrophy. IFN nucleic acids and polypeptides are also useful for containing the profiled prevention and as targets for the identification of small molecules that are immunosure cell arouth in mammals. Including histages normal conformance in activity or the identification of small molecules that are immunosured the mammals. Including histages normal conformance in activity or the identification of small molecules that are immunosured the mammals. Including histages normal conformal including histages.

They are useful for CC determining the presence of or predisposition to a discase associated CC with altered levels of IFN polypeptide or polypucleotide. IFN nucleic CC acids, polypeptides and antibodies are useful for diagnosis, prevention or treatment of variety of immunological and cell proliferative CC disorders, such as autoimmune diseases e.g. lupus erythematosus. CC immunodeficiency diseases such as acquired immunodeficiency syndrome CC (AIDS), graft rejection, viral infections including hepatitis and human CC immunodeficiency virus (HIV), immune-mediated glomerulo-pehritis, CC haematologic diseases such as aplastic anaemia and chronic neutropaenia CC and cancer. In addition they are also useful for treating or diagnosing CC various disorders associated with cell death, including impocardial CC infarction, stroke, neurological diseases including Alcheimer's and CC parkinson's diseases, amyotrophic lateral sclerosis and spinal muscular atrophy. IFN nucleic acids and polypeptides are also useful for screening drugs and compounds which inhibit or enhance IFN activity or function and as targets for the identification of small molecules that CC are immunostimulatory, immunosuppressive, or simulate or suppress normal CC cell or tumour cell growth in mammals, including humans.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          200
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               180
```

polypeptide (II) sequences. (I) is useful as hybridisation protes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diamners.

(II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification or mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from MIPO as for any product sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 956 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -515-363C-2 (1-1025) x AAS91688
                                                                                                                                                           631

Pred. No.:
                                                    The present invention relates to the isolation of novel human enzyme compositions (AMU22915-AAU23814), and the cDNA and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the clisorders including hyperproliferative disorders (e.g. cancer), communication of a wide range of clisorders including hyperproliferative disorders (e.g. cancer), communication of a wide range of clisorders including hyperproliferative disorders (e.g. cancer), communication of a wide range of clisorders including hyperproliferative disorders (e.g. cancer), communication of a wide range of clisorders including hyperproliferative disorders (e.g. cancer), communication of a wide range of communication of a cancer of communication of a wide range of communication of a cancer of cancer of central disorders (e.g. alphabatory disorders (e.g. influence). The polypucteotides of the invention can also be used in gene therapy. Ass40785-Ass41684 represent cDNA sequences encoding for the novel human companies of the invention of the printed companies of the invention of the printed specification, but was obtained in electronic format directly from WIPO capture of the printed specification, but was obtained in electronic format directly from WIPO captures of the invention of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-DEC-2000

```
The sequence represents interferon induced nucleic acid, IFN5. IFN
C nucleic acids and polypeptides are useful for treating or preventing a
CC pathology associated with IFN polypeptide in a human. They are useful for
CC determining the presence of or predisposition to a discase associated
CC with altered levels of IFN polypeptide or polynucleotide. IFN nucleic
CC acids, polypeptides and antibodies are useful for discases, prevention
CC or treatment of variety of immunological and cell proliferative
CC disorders, such as autoimmune diseases e.g. lugus erythematosus,
CC immunodeficiency diseases such as acquired immunodeficiency syndrome
CC (AIDS), graft rejection, viral infections including hepatitis and human
CC immunodeficiency virus (HIV), immune-mediated glomerulonephritis,
CC haematologic diseases such as aplastic anaemia and chronic neutropenia
CC and cancer. In addition they are also useful for treating or diagnosing
CC various disorders associated with cell death, including inyocardial
CC infarction, stroke, neurological diseases including Alzheimer's and
CC parkinson's diseases, amyotrophic lateral sclerosis and spinal muscular
CC atrophy. IFN nucleic acids and polypeptides are also useful for
CC screening drugs and compounds which inhibit or enhance IFN activity or
CC care immunostinates for the identification of small molecules that
CC are immunostinates for the identification of small molecules that
